Navigation Cheatsheet

> Start Screen

When opening Power BI the default screen is the Report view. There are three views: Report, Data, and Model view, which can be accessed through the icons on the left side of the screen. The Power Query Editor can be found in the Home tab.

> Model View

The Model view provides a visual representation of the relationships among the tables. It shows all tables and columns in your model.

> Data View

The Data View allows you to monitor, explore, and understand your data. You can explore each table, value, column and row. The Data view is different than the Power Query Editor because you're working at your data after it has been loaded into this view.

> Power Query Editor

This Power Query Editor opens in a separate window. It helps you to build queries and transform data before loading it in the refined data model to create reports.
